

Add an x64 configuration (C#)

To add *x64* and remove the default *AnyCPU* configuration, follow these steps:

1. Open the configuration Manager

2. Select New... from the platform combo

3. Choose x64 for the new platform and click OK.

At this point you are good to go. You will notice that your project has been switched to x64.

However, to avoid any confusion you can remove the *AnyCPU* platform from you configuration with the next three steps.

4. Select Edit... from the platform combo.

5. Select *AnyCPU* and click **Remove**.

6. And confirm.
